

Aegis Home System — Draft v6 V2.0

Adding Aegis Embark Vehicle Integration and Garage Zone

Version 2.0 — June 2026

Iteration 6 extends the Dielectric Citadel from the home into the driveway — protecting the vehicle interface zone.

Δ Change Log

- LoRa mesh: home + vehicle form unified navigation network
- Vehicle charging station: dielectric isolating coupler added
- Garage structural elements: BFRP overhead door track system

New V6 Components

15. **Garage BFRP Door Track System** — eliminates steel overhead door track (GIC loop); aluminum rail replaced with BFRP; ceramic roller bearings; Zirconia spring drums
16. **Dielectric EV Charging Station** — ceramic-isolated CCS/CHAdemo coupler; DC blocking capacitor on ground pin; optical fiber control signal (no copper data line)
17. **Aegis Embark Vehicle Products (full suite)** — CSMFAB 024–038 products specified for household vehicle fleet
18. **Home-Vehicle LoRa Mesh** — seamless navigation network handoff from home Schumann monitors to vehicle Way-Finder insoles for post-event coordination
19. **Garage Floor: Piezoelectric PEHG tiles** — $1.5 \text{ W/m}^2 \cdot \text{cycle}$ □ daily EV charging support

V6 adds: The home now extends its electromagnetic protection philosophy to the vehicle fleet and provides an energy-harvesting, GIC-immune charging and navigation infrastructure.

V6 cumulative GIC threat reduction: ~93%
