

CSMBiz00000000001 V2.0

Enterprise AI Orchestration: Autonomous Amusement Device Operations powered by Kilo AI

Version 2.0 — Revised & Expanded | June 2026

Document Type: Business Architecture & Regulatory Compliance **Original:** CSMBiz00000000001 — AI Agents For Kilo Claw Business

Δ Change Log V1.0 → V2.0

- Kilo AI agent framework: updated to 2026 capability tiers (multi-agent parallel execution)
 - Legal compliance: California AB 2930 (2024 AI employment law) incorporated
 - FTC AI business guidelines (2025): disclosure requirements updated
 - Real-time IoT integration: LoRa mesh for GPS-free asset tracking added
 - Phoenix Protocol circular economy integration for physical machine recycling
 - Solar Cycle 25 context: critical backup power protocols for GIC events
 - Edge AI deployment: Sonnet 4.6 model on local Carrington-immune hardware
-

1. Executive Summary V2.0

The Kilo Claw enterprise AI architecture governs a fleet of autonomous claw machine amusement devices across multiple locations. V2.0 updates the foundational V1.0 design with 2025-2026 regulatory, technological, and resiliency advances.

The 2026 enterprise landscape requires AI-managed physical operations to comply with: - **California AB 2930 (2024):** Requires human oversight disclosure for all autonomous physical systems affecting consumer interactions - **FTC AI Commercial Practices Guidance (2025):** Mandates transparency in AI-driven pricing and game probability settings - **CPSC Smart Device Safety Standards (2025):** IoT-enabled amusement devices must include fail-safe offline operational mode

V2.0 Carrington resilience addition: All 23 AI agent nodes must have a local fallback computation mode using Carrington-immune hardware (CSMFAB-certified BFRP enclosures with MXene EMI shielding) to maintain minimal operation during G5 events.

2. AI Agent Architecture V2.0 — Updated 23-Agent Framework

2.1 Tier 1 — Executive Orchestration Layer (Updated)

Primary Orchestrator Agent (POA): - Model: Claude Sonnet 4.6 or equivalent (Kilo AI cloud deployment) - Function: Routes tasks to specialist sub-agents, maintains enterprise state - V2.0 update: Now includes parallel sub-agent fan-out (previously sequential) - New capability: Real-time competitor price monitoring via autonomous web search - Fallback: Local MRAM-stored decision tree for offline operation during connectivity loss

Financial Compliance Agent (FCA) — V2.0: - Tracks California CCPA data privacy for player loyalty programs - Reconciles crypto payments (added 2025 — California now permits crypto for amusements) - AB 1234 (2025) amusement device prize value disclosure compliance - QuickBooks Online API integration → real-time P&L per machine per location

Location Strategy Agent (LSA) — V2.0: - Demographic analysis: now uses 2024 census tract updates - Foot traffic prediction: LiDAR pedestrian count APIs from City of LA open data - GIC risk assessment: integrates USGS geoelectric hazard map to assess location vulnerability — avoids high-conductivity soil zones for machine siting - New: identifies locations near emergency services for brand resilience during crises

2.2 Tier 2 — Operations Layer (V2.0 Updates)

Physical Asset Management Agent (PAMA) — V2.0: - LoRa mesh telemetry replaces WiFi/cellular IoT (immune to cellular network failure) - LoRa frequency: 915 MHz; one node per 15 machines; range 5 km - Each machine node reports: coin count, claw position, prize inventory, motor current - During GIC events: LoRa mesh continues operating; provides asset status to POA - Predictive maintenance: LSTM neural network trained on 1.2M machine cycles predicts motor failure 72 hours in advance (2025 capability)

Inventory Replenishment Agent (IRA) — V2.0: - AI-optimized prize mix per demographic profile (collaborative filtering) - Partnership with Alibaba B2B sourcing API for automated prize procurement - CPSC product safety database integration: auto-rejects prizes recalled in last 90 days - Phoenix Protocol provision: prizes returned by customers → donated to charity (reputational ESG metric tracked by dedicated ESG Agent)

3. Regulatory Compliance Matrix V2.0

Regulation	Jurisdiction	V1.0 Status	V2.0 Update
AB 2930 AI Employment Disclosure	California	Not in V1.0	Full disclosure template added
FTC AI Guidance (2025)	Federal	Not in V1.0	Probability display on all machines
CPSC Smart Device Safety	Federal	Mentioned	Full offline fallback implemented
California Tax Code §19542	CA	Basic coverage	AI tax prep automation added
ADA Sections 4.34-4.35	Federal	Basic	Height/access audit per location
CCPA 2.0 (2023)	California	Partial	Full data minimization protocol

4. Carrington Event Business Continuity V2.0

4.1 GIC Impact on Physical Amusement Operations

A G5 geomagnetic event induces GICs that can: - Destroy point-of-sale (POS) terminal electronics (metal-chassis, copper-wired) - Disable cellular payment networks (base stations lose grid power) - Corrupt cloud AI agent memory states (satellite link interruption) - Heat conductive machine housings → customer burn risk

V2.0 Resiliency Protocol: 1. All claw machine control electronics: BFRP-encased, MXene-shielded (SE=92 dB) 2. Payment: offline-first cash mode + local SQLite transaction log 3. AI agents: local MRAM-stored fallback rules (“if coin inserted, operate machine”) 4. Power: LiFePO4 UPS per machine (2 kWh, 4-hour backup) 5. Communications: LoRa mesh allows location manager to check status without internet

5. Operational Revenue Model V2.0

At 120 machines across 15 California locations: - Average revenue per machine/day: \$85-145 (2026 projections) - Annual gross: \$3.7M-\$6.3M - AI agent cost (Kilo AI cloud): \$2,400-\$4,800/yr - GIC hardening premium per machine: +\$1,200 upfront □ zero storm-related downtime - **ROI**: First major storm event recovers GIC investment 100× (vs. destroyed non-hardened fleet)
